By ECF

The Honorable Jesse M. Furman
United States District Judge
Southern District of New York
40 Foley Square
New York, N.Y. 10007

Application GRANTED. Sentencing is hereby
ADJOURNED to February 7, 2023, at 3:00 p.m..
SO ORDERED.

October 7, 2022

Re: *United States v. Tracii Hutson*, 21 Cr. 299

Dear Judge Furman:

I write to respectfully request a two-month adjournment of Ms. Hutsona's sentencing hearing, currently scheduled for November 3, 2022. At the attached materials indicate, Ms. Hutsona is undergoing a 90-day treatment for long Covid and has been advised to complete the treatment before traveling to New York. The government has no objection to an adjournment.

Thank you for your consideration.

Respectfully submitted,

/s/

Deborah Colson

To Whom It May Concern,

Please understand that Tracii Hutsona is currently being treated for long-hauler COVID-19. This means she has multiple medications to take daily as well as daily injections for at least the next 90 days. Therefore, this treatment plan is not conducive to travel. As an alternative for any future meetings or conferences, Tracii is better suited to participate in these via virtual teleconferences.

Thank you for your understanding.

Feel free to contact our office, Scottsdale Medical Center, with any questions you may have at 480-614-5808.

Sincerely,

Kathryn DiGiammarino, FNP-BC

PREVENTION & TREATMENT PROTOCOLS FOR COVID-19

I-RECOVER

LONG COVID TREATMENT

An Approach to Treating Long COVID

Up to 80% of patients experience prolonged illness after COVID-19, characterized by prolonged malaise, headaches, generalized fatigue, sleep difficulties, hair loss, smell disorder, decreased appetite, painful joints, dyspnea, chest pain and cognitive dysfunction. Long COVID may persist for months after acute infection, and it is likely that patients who did not receive adequate treatment during the symptomatic phase are much more likely to develop long COVID. Treatment should be individualized to clinical signs and symptoms.

FIRST LINE THERAPIES

In order of priority; not all required.

- **Prednisone:** 10-15 mg daily for 3 weeks. Taper to 10 mg for three days, then 5 mg for three days, then stop.
- **Ivermectin:** 0.2–0.3 mg/kg daily for 2-3 weeks.
- **Low dose naltrexone (LDN):** Begin with 1 mg daily, increase to 4.5 mg daily as required.
May take 2-3 months for full effect.
- **Intermittent daily fasting and/or periodic daily fasts:** (Prolonged) Fasting window 7a-7p
Fasting promotes autophagy, the body's protective mechanism to remove misfolded, foreign and damaged proteins. It also promotes mitophagy and the release of stem cells. It is likely that promoting autophagy will aid in the removal of the spike protein. NOTE: Hydroxychloroquine inhibits autophagy and should be avoided in patients undergoing intermittent fasting.
- **Spermidine and/or Resveratrol:**
These compounds have been demonstrated to augment autophagy. Wheatgerm, mushrooms, grapefruit, apples and mango are high natural sources of spermidine. A bio-enhanced formulation containing trans-resveratrol from Japanese Knotwood Root appears to have good bio-availability.
- **Melatonin:** 8 mg at night (slow release/extended release preferred).
Patients should pay attention to good sleep habits. Increase dose from 1 mg as tolerated (may cause severe bad dreams at high dosages).
- **Vitamin D:**
The majority of those with long COVID continue to have Vitamin D deficiency. Patients may require a loading dose based on baseline Vitamin D levels (see Table 2). If baseline levels are unknown, the needed dose can be calculated from body weight or BMI (see Table 3).
- **Omega-3 fatty acids:** Vascepa, Lovaza or DHA/EPA 4 g day.
- **Aspirin:** 81 mg daily.
- **Curcumin (turmeric):** 500 mg twice daily.

SECOND LINE THERAPIES
